

An AI Onboarding Layer over Ariba & SAP

How Aerchain slots in as the intelligent vendor onboarding and due-diligence layer across Adani's existing SAP Ariba and SAP ERP estate — reconciling the Ariba Network ID, the SAP Vendor Master, and Aerchain's golden vendor record into one governed lifecycle, without replacing Ariba or SAP on day one.

01 CONTEXT & INTENT

The Problem We're Solving

Adani is introducing Aerchain as an AI onboarding layer over an existing, working procurement estate. The goal is not to rip and replace — it is to make vendor onboarding and due diligence intelligent *first*, while keeping Ariba and SAP exactly where they are.

— TWO HORIZONS, ONE LAYER

- 1

Near term — augment. Aerchain sits on top of the integrated Ariba + SAP stack as the AI onboarding and due-diligence brain. Ariba continues to run registration and sourcing events; SAP continues to hold the approved Vendor Master. Aerchain adds intelligence, governance and speed without forcing a cutover.
- 2

Eventual — absorb. As confidence builds, Aerchain progressively takes over the registration front-end and the sourcing capability (RFx and auctions), reducing dependence on Ariba on Adani's timeline — never as a big-bang.

The question this document answers. A vendor cannot participate in an Ariba sourcing event without an **Ariba Network ID (ANID)**. So if Aerchain becomes the onboarding brain, how does a vendor still get an ANID to bid — and how do the **ANID**, the **SAP Vendor Master ID** and **Aerchain's vendor record** stay reconciled across registration, bidding, award and payment? That loop is what we close below.

02 AS-IS

How Adani Runs Vendors Today

Three systems, one handoff point. The estate works — but onboarding intelligence and due diligence are manual, and vendor identity is split across two systems with no governed link between them.

- SAP ERP — Vendor Master (system of record).** Holds approved, transactable vendors. A **SAP Vendor Master ID** is created only when a vendor is formally onboarded — in practice, at award. Drives PO, invoicing, bank and tax.
- SAP Ariba — registration & sourcing.** Vendors register on Ariba and receive an **ANID**. With an ANID they can be invited to RFQs, RFPs and auctions. A large population of vendors are *Ariba-only* — registered and bidding, but never promoted to SAP because they never won.
- Third-party due diligence — manual.** Sanctions, adverse-media, financial and legal checks are run through a separate process, by hand, on email and spreadsheets — slow, inconsistent, and hard to audit or configure per business unit.

03 RECONCILIATION MODEL

Four IDs, One Golden Record

Aerchain does not introduce a competing identifier. It introduces the record that reconciles the SAP-side identifiers that already exist — so a vendor is tracked cleanly from first invite through to payment. **Mechanics validated against SAP Ariba SLP & SAP Business Network documentation — see §09.**

The linking principle. Aerchain keys its golden record to the SLP **SM Vendor ID** at first touch, binds the **ANID** the moment SAP Business Network issues it on supplier activation, and binds the **ERP Vendor ID (LIFNR)** when MDG-S creates the master. Whichever system a query starts from, the others resolve through the golden record.

04 TO-BE OPERATING MODEL

Staged Onboarding, Dual Entry

Both registration channels stay open — vendors can start in Aerchain or in Ariba — with Aerchain as the primary, governing record either way. Due diligence is staged: light to qualify for bidding, deep to qualify for the SAP master at award.

05 CONNECTIVITY

How the Layers Connect

Aerchain integrates through APIs and events where systems support them, and file-based exchange where they don't — reading from, triggering, and writing back to Ariba and SAP without owning their core functions.
