AERCHAIN

June 2026 | ● STRICTLY CONFIDENTIAL

BUSINESS CASE · JUNE 2026 · AERCHAIN × ADANI GROUP

Procurement at the **Speed of Thought**

A bottom-up, channel-by-channel case for unlocking `$0.45B–$0.75B` in identified annual value across the Adani Group's ~`$12B` addressable & influenceable spend — carved out of a ~`$20B` gross procurement engine — by orchestrating AI-native sourcing on top of the existing SAP estate.

GROSS SPEND	ADDRESSABLE SPEND	PROCUREMENT CYCLES	CATEGORIES
`~$20–22B`	`~$12B`	`~300K / yr`	`140–180`

PREPARED FOR	PREPARED BY	CLASSIFICATION
Adani Group — Group Procurement & CPO Office	Aerchain (Agillos E-Commerce Pvt. Ltd.)	Strictly Confidential

01 Executive Summary

Identified annual value	Cycle-time reduction	Buyer capacity unlock	Payback
`$0.45–0.75B`	`−40%`	`~2–3×`	`< 12 mo`
at steady state, on ~$12B addressable spend	complex sourced categories: ~24d → ~14d*	strategic throughput, no net hiring	value dwarfs total Y1 cost ~100–170×

The Adani Group already runs one of India's most digitally mature procurement functions — SAP Ariba and SAP Business Network across ~24 businesses, **~300,000 procurement cycles a year, of which ~100,000 become formal POs** — the rest are catalog, non-PO, tail and invoice events — and ~94% first-time-right digital invoicing. The remaining opportunity is not digitisation; it is **orchestration and judgment at scale**, concentrated in the low-maturity **tail, non-PO and tactical** zone rather than the already-digitised strategic core. By layering Aerchain's AI-native sourcing suite on top of the existing SAP estate, the Group can compress cycle times, redirect scarce buyer hours from administrative churn to high-leverage negotiation, and capture **$0.45B–$0.75B/yr** of conservatively-modelled, bottom-up category savings on its **~$12B of addressable & influenceable spend** — while strengthening compliance, ESG screening, and audit governance.

> **The single message:** Adani has built the rails; Aerchain runs the trains at the speed of thought — converting a mature-but-manual procurement engine into an autonomous one, with `$0.45–0.75B` of identified annual value (on ~$12B addressable spend) against a platform cost of ~`$2.1M/yr`.

02 What we heard — Adani today

Credibility first. Adani is **not** a laggard to be fixed — it is a leader to be accelerated. The foundations below are exactly what make an AI-native orchestration layer land quickly and safely.

Digital backbone	Procurement cycles / yr	Invoicing quality	Tier-1 suppliers
SAP Ariba	`~300K`	`~94%`	`7,865`
+ SAP Business Network, ~24 businesses	of which ~100K become formal POs	first-time-right digital invoicing	~35% MSME / local sourcing

THE ESTATE

ERP landscape	`14 → 18 SAP S/4HANA instances`
Sourcing / P2P	SAP Ariba + SAP Business Network
Businesses	`~24`
Employees	`35–40K`
Categories	`140–180`

THE MANDATE SIGNALS

Annual spend	`$20–22B (~$36–38B revenue)`
MSME / local	`~35%`
ESG	Supplier ESG screening in place
Coal exposure	`>60%`
Complex-cat P2P	`~24-day median cycle*`

⇄ Mandate mirror — Adani priorities map directly to Aerchain modules

Every stated Adani priority has a one-to-one Aerchain capability. Nothing here requires re-platforming.

ADANI PRIORITY		
Standardise sourcing across 24 businesses without ripping out SAP	→	**Aerchain S2P orchestration layer** Sits on SAP Ariba / S/4HANA — `zero rip-and-replace`, one playbook across BUs
Apply scarce buyer time only where judgment adds value	→	**Autonomous & Guided Sourcing** AI runs tail & tactical events end-to-end — `~60%` of buyer week returned to strategy
Get faster, more defensible savings on coal, fuel & EPC	→	**Strategic Sourcing + Cleansheet / e-Auction** Should-cost + auctions at scale on `~$4.0B` addressable strategic spend (EPC, heavy equipment, non-fuel logistics & services)

ADANI PRIORITY
Control tail spend & off-contract leakage
→
Catalog + Self-Service PO + Tail automation
Maverick `~35–45%` → `<10%` via guided buying

ADANI PRIORITY
Onboard & risk-screen 7,865 suppliers faster
→
AI Vendor Onboarding & Due Diligence
Onboarding cycle `−50%`; automated risk / ESG at entry

ADANI PRIORITY
Support the coal-transition & decarbonisation agenda
→
ESG Screening + Immutable Audit Ledger
ESG scoring at onboarding; `+20%` compliance, full audit trail

03 The opportunity — where the value is

Not every dollar of the ~$20B is a sourcing lever. Before modelling savings, we carve the gross spend down to what is genuinely **addressable & influenceable** — and hold the commodity / captive remainder to a separate, non-savings-percentage value lens.

↓ Addressable-spend waterfall

Gross procurement is discounted for spend that a sourcing platform cannot move on price — index-linked commodity & fuel, and intra-group / related-party transfers — leaving the base on which savings percentages are actually applied.

SPEND LAYER	AMOUNT	RUNNING BASE	SAVINGS LEVER
Gross procurement total spend across ~24 businesses	`$20.0B`	`$20.0B`	–
less Commodity & fuel pass-through coal / LNG / fuel — index-linked, long-term-contracted, partly captive	`−$7.0B`	`$13.0B`	`cycle-time / benchmarking / compliance only`
less Intra-group / related-party captive transfers, not open-market sourceable	`−$1.0B`	`$12.0B`	`governance / audit only`
Addressable & influenceable spend	`≈$12.0B`	`$12.0B`	`full savings-% lever`

Why this matters: the `~$8B` of commodity & captive spend is **excluded from the savings-percentage model**. It is index-linked, long-term-contracted or intra-group — a sourcing platform does not move its unit price. That $8B still yields value, but only via **cycle-time compression, benchmarking transparency, and compliance / governance**, not a negotiated savings rate. Every savings figure in this case is applied to the `~$12B addressable` base, never the full $20B.

The gross spend map below shows *where the dollars sit* across all channels (pre-carve-out); the savings model in Section 04 works strictly on the ~$12B addressable subset.

CHANNEL	% OF SPEND	~$ VALUE	% OF TXNS
Strategic Sourcing (RFx / negotiated) Structured RFx, high value, low volume	`35%`	`~$7.0B`	`~12%`
Tactical Sourcing (guided RFQ) Repeatable mid-value buys	`20%`	`~$4.0B`	`~18%`
Catalog / Self-Service PO Punch-out & requisition-to-PO	`20%`	`~$4.0B`	`~34%`
Non-PO / Services / RC Recurring & services invoices	`15%`	`~$3.0B`	`~22%`
Tail (<$50K, ad-hoc / local) Long-tail, one-off, local buys	`10%`	`~$2.0B`	`~14%`
Total	`100%`	`~$20B`	`100%`

The Pareto / long-tail hook: roughly `20%` of spend generates close to `~80%` of transactions in the tactical-and-tail zone. Today, expensive strategic-buyer hours are consumed processing low-value, high-frequency events. Aerchain reverses this: **procurement effort applied selectively where human judgment creates the most value**, with AI orchestrating the high-volume remainder autonomously.

COAL / LNG / FUEL
45%
of spend — the strategic prize

CAPITAL PROJECTS / EPC
25%
$5–5.5B capital book; speed = value

INDIRECT + SERVICES + TAIL
30%
indirect 18% · services/RC 7% · tail 5%

04 The savings model (bottom-up)

Modelled **channel-by-channel on the ~$12B addressable base** (not the full $20B), across five orchestrated Aerchain channels. Percentages are deliberately conservative. The sum is the headline value. The ~$8B of commodity & captive spend is **excluded** here — it contributes value only through cycle-time, benchmarking and compliance / governance, not a savings rate.

CHANNEL	SPEND	SAVINGS %	ANNUAL SAVINGS

Strategic Sourcing EPC, heavy equipment, non-fuel logistics & services	`$4.0B`	`5–8%`	`$200–320M`
Tactical Sourcing Guided RFQ, mid-value repeatable	`$3.0B`	`4–7%`	`$120–210M`
Catalog & Self-Service Indirect — punch-out & guided requisition-to-PO	`$2.5B`	`2–4%`	`$50–100M`
Tail & Non-PO Autonomous events + off-contract recovery	`$1.5B`	`3–6%`	`$45–90M`
Services / RC Invoice Recurring / contract invoices	`$1.0B`	`2–4%`	`$20–40M`
Total — identified annual value (addressable)	**`$12.0B`**	**`~3.6–6.3%`**	**`$435M–$760M`**

Read it as: `$0.45B–$0.75B` of identified, addressable annual value on the `~$12B` influenceable base — conservative, modelled bottom-up by channel. These savings **compound across years** as contracts renew on improved baselines, catalog coverage widens, and autonomous coverage climbs from Wave 1 to Wave 3.

Sensitivity — conservative / base / upside

Three scenarios on the same ~$12B addressable base, flexing the blended realised savings rate. Realisation carries execution risk (adoption, data readiness, wave sequencing) — but even the conservative case dwarfs the cost.

SCENARIO	ADDRESSABLE BASE	BLENDED RATE	ANNUAL VALUE
Conservative slower adoption, partial wave coverage	`$12.0B`	`~3.0%`	`~$360M`
Base planned rollout, expected realisation	`$12.0B`	`~4.5%`	`~$540M`
Upside full coverage, baselines reset on renewal	`$12.0B`	`~6.3%`	`~$760M`

Realisation-risk note: value ramps with the wave rollout and is not realised in full on day one — expect `~30%` of steady-state in Year 1, `~70%` in Year 2, and `100%` by Year 3. Even so, the **conservative ~$360M** case still exceeds the ~$4.45M total Year-1 investment by `~80×+` — the downside case remains overwhelmingly positive.

`05` Double-click: the benefits, decomposed

This is the core of the document. Each benefit is decomposed at three altitudes — **(a) Mechanism** (how the AI achieves it), **(b) Resource & time analysis** (where the hours/days go, today vs. after), and **(c) Calculation → $ value & ROI** (baseline → improved → delta → dollars).

`1` Hard-dollar category savings

Three marquee channels carry the bulk of the hard-dollar case, all on the **~$12B addressable base**. Each is a "today vs. with Aerchain" delta driven by a specific AI mechanism.

Where the gains actually live: Adani already runs ~94% first-time-right and a mature Ariba backbone — so the efficiency upside is **not** in the already-digitised strategic core. It sits in the **tail, non-PO and tactical** zone: low process maturity, high transaction volume, and the bulk of off-contract leakage. That is where guided buying and autonomous events convert manual, unmanaged activity into governed, competed spend.

`i` Strategic Sourcing — EPC, heavy equipment, non-fuel logistics & services

Strategic · `$4.0B` addressable spend · driver: consolidated demand & should-cost

● **TODAY**

Category managers negotiate BU-by-BU on spreadsheets and prior-year price. Demand is fragmented across ~24 businesses; cleansheets, where they exist, are one-off and manual. Auctions are rare on complex categories.

2–3%
TYPICAL REALISED SAVINGS

● **WITH AERCHAIN**

Group demand is consolidated into single sourcing events; AI-generated cleansheet / should-cost models set the negotiation floor; large-scale e-auctions run on qualified vendor pools. Human buyers own strategy and award.

5–8%
→ $200–320M / YR

⚡ Cleansheet + e-Auction at scale

`ii` Tactical Sourcing — guided RFQ

Tactical · `$3.0B` addressable spend · driver: playbook-driven competition replacing ad-hoc buys

● **TODAY**

Mid-value buys are placed locally — often single-source, often on last price. Buyers lack time to run a proper 3-bid RFQ, so competitive tension is left on the table across thousands of events a year.

~1%
COMPETITION CAPTURED

● **WITH AERCHAIN**

A guided-RFQ playbook auto-drafts the event, invites qualified vendors, and normalises bids — making a competitive 3+ bid the default path, not the exception. Buyers approve, not assemble.

4–7%
→ $120–210M / YR

⚡ Playbook-driven guided RFQ

iii Tail & Non-PO — leakage recovery

Tail + Non-PO · `$1.5B` addressable · driver: autonomous events + consolidation + off-contract recovery

● **TODAY**

The high-volume, low-maturity zone — minimal oversight. Off-contract and maverick buying runs ~35–45%; the same item is bought at different prices across BUs; non-PO leakage escapes negotiated rates entirely.

35–45%
MAVERICK / OFF-CONTRACT

● **WITH AERCHAIN**

Autonomous sourcing runs tail events without a buyer; demand is consolidated to contracted vendors; off-contract spend is intercepted and routed to catalog/negotiated rates. Maverick falls below 10%.

3–6%
→ ~$45–90M / YR

⚡ Autonomous events + leakage recovery

Marquee subtotal: `$200–320M` (strategic) + `$120–210M` (tactical) + `~$45–90M` (tail & non-PO) ≈ `$365M–$620M` of the total identified value comes from these three alone.

---

2 Cycle-time reduction (−40%, complex sourced categories)

MECHANISM Scoped to **complex sourced categories** (structured RFx / negotiated events). AI compresses the manual, sequential steps of a complex sourcing cycle. RFx documents are generated from templates and prior awards in hours instead of days; incoming offers are OCR-parsed and normalised to a common schema in minutes; each vendor is scored against technical and commercial criteria automatically; and approvals/NFAs are auto-routed rather than chased by email.

RESOURCE & TIME The saved days come out of **buyer and category-manager hours** and out of **approver wait-time**. A complex event that ties up a buyer for parts of ~24 elapsed days now clears in ~14 — freeing both the buyer's active hours and the queue behind them. **The ~24-day baseline is indicative, to be validated on Adani's data.**

CALC → $ Baseline median **~24 days*→** improved **~14 days** = **−10 days (−40%)** on complex sourced categories. On a **$5–5.5B capital-projects book**, faster award means faster mobilisation — each cycle-week saved advances capex deployment and releases working capital tied up in stalled projects.

Where the ten days come from — stage by stage:

STAGE	TODAY	AERCHAIN	DELTA
RFx drafting & scoping AI generation from templates + prior events	`5 d`	`1 d`	`−4 d`
Offer extraction & normalisation OCR + AI parsing to a common schema	`3 d`	`0.5 d`	`−2.5 d`
Technical + commercial evaluation Per-vendor AI scoring vs. criteria	`6 d`	`4 d`	`−2 d`
Clarifications & negotiation AI drafts; buyer decides	`5 d`	`5 d`	`0 d`
Approvals / NFA routing Auto-routing vs. manual chase	`5 d`	`3.5 d`	`−1.5 d`
Complex sourced-category P2P median	`~24 d*`	`~14 d`	`−40%`

** Scoped to complex sourced categories; the ~24-day baseline is indicative and to be validated on Adani's data.*

Capex link: on Adani's `$5–5.5B` capital-projects book, shaving `10 days` off every sourcing cycle pulls mobilisation forward across the portfolio — a direct working-capital and time-to-revenue benefit on top of the price savings.

---

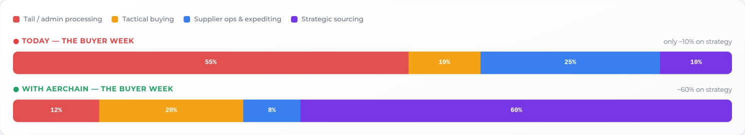
3 Buyer capacity / productivity (+35% → ~2–3× strategic throughput)

MECHANISM Autonomous and guided sourcing absorb the tail and tactical admin that consumes most of a buyer's week. AI drafts RFx, normalises offers, scores vendors, and chases approvals — so the human buyer's hours shift from **assembling** events to **deciding and negotiating** them.

RESOURCE & TIME Reallocating the buyer week: tail/admin **55% → 12%**, supplier ops **25% → 8%**, tactical **10% → 20%**, strategic **10% → 60%**. Strategic time rises ~6× as a share — the practical effect is **~2–3× strategic throughput** per buyer and ~+35% overall productivity.

CALC → $ Group sourcing org ≈ **250 FTEs** (**illustrative — to be validated with Adani's actual team size**). The arithmetic: 250 FTE × (2–3× strategic throughput − 1) ≈ **~250–500 FTE-equivalent** of added strategic capacity — **without hiring**. At a fully-loaded ~$60–90K/FTE that capacity is worth **~$15–45M/yr** as an avoided-headcount reference. **This is an alternative lens, not additive** to the hard-dollar savings — the freed buyer-hours are the mechanism that captures those savings, so the two are not summed.

The buyer week, reallocated:



The arithmetic: 250 FTEs (illustrative) × (2–3× strategic throughput − 1) ≈ `~250–500` FTE-equivalent of added strategic capacity — unlocked without a single net-new hire. Capacity, not cost, becomes the constraint that Aerchain removes. Presented as an alternative lens on the same value, not a separate line added to the savings total.

4 Tail-spend & maverick control

MECHANISM Every requisition is routed through guided buying: if a contract or catalog price exists, the buyer is steered to it; if not, an autonomous event is triggered. Off-contract attempts are intercepted at the point of demand, not discovered in an audit months later.

RESOURCE & TIME This is **demand-side** control — it does not add buyer hours, it removes the need for them. ~20% of spend / ~80% of transactions move from unmanaged to governed with no incremental headcount.

CALC → $ Maverick spend **35–45% → <10%**; leakage recovery of **3–6%** on the ~$1.5B addressable tail/non-PO base underpins the **~$45–90M** in the savings model. Vendor consolidation across **7,865** tier-1 suppliers compounds the effect.

Before / after — the tail:

TODAY — TAIL OUT OF CONTROL maverick

Maverick / off-contract	35–45%
Tail transactions	~80% of vol.
Duplicate vendors	7,865 tier-1
Price variance same-SKU	high

Off-contract spend escapes negotiated rates; the same item is bought at many prices across ~24 BUs.

WITH AERCHAIN — TAIL GOVERNED controlled

Maverick / off-contract	< 10%
Tail run autonomously	majority
Vendor base	consolidated
Leakage recovered	3–6%

Guided buying + autonomous events pull tail onto contracts; consolidation across 7,865 suppliers recovers 3–6% leakage.

5 Vendor onboarding & due diligence (–50% cycle)

MECHANISM AI-driven onboarding collects and validates supplier documents, auto-runs due-diligence and sanctions/risk checks, and applies ESG screening at the point of entry — replacing weeks of manual back-and-forth.

RESOURCE & TIME Removes onboarding load from category and compliance teams; new suppliers reach first-PO readiness in days rather than weeks, accelerating time-to-value on new sources and MSME inclusion.

CALC → $ Onboarding cycle **–50%** (4–6 wks → 2–3 wks). Faster, safer supplier activation directly supports the **~35% MSME/local** agenda and shortens the path from sourcing decision to delivered value.

Before / after — onboarding:

TODAY — MANUAL ONBOARDING ~4–6 wks

Onboarding cycle	4–6 wks
Diligence	manual, email
Risk / ESG check	ad-hoc
Time-to-first-PO	weeks

Documents chased over email; diligence is inconsistent across BUs; risk surfaces late.

WITH AERCHAIN — AI ONBOARDING –50%

Onboarding cycle	2–3 wks
Diligence	automated
Risk / ESG check	at entry
Time-to-first-PO	days

AI collects & validates documents, runs automated diligence and ESG screening, and stands the vendor up in half the time.

6 Compliance, governance & ESG

MECHANISM Every event, approval, and award is captured on an immutable audit ledger; policy is enforced in-flow (guided buying, mandatory competition thresholds, approval matrices); ESG criteria are screened at onboarding and re-checked at re-qualification.

RESOURCE & TIME Shifts governance from **after-the-fact audit** to **in-flow enforcement** — compliance and internal-audit teams review exceptions, not the whole population.

CALC → $ Compliance rate **+20%**; a complete, tamper-evident audit trail across ~100K annual transactions. With **>60% of revenue coal-linked**, ESG screening at onboarding directly supports the Group's coal-transition and decarbonisation agenda — measurable supplier-level sustainability data, not attestations.

Compliance rate
+20%
policy enforced in-flow

Audit trail
Immutable
tamper-evident ledger, ~100K txns

ESG screening
At entry
supports coal-transition agenda

Coal exposure
>60%
of revenue — decarbonisation focus

7 P2P / AP value — the pay-side (additional, not double-counted)

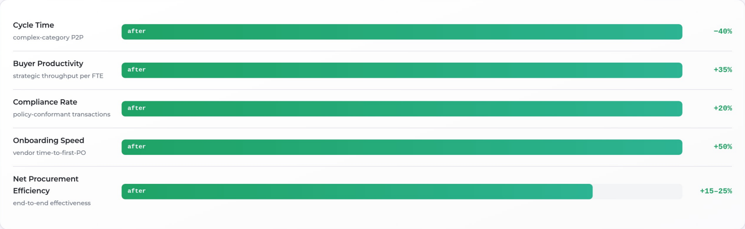
The sourcing-savings table above is buy-side. The P2P module unlocks a separate, **pay-side** value pool once invoices and payments flow through the platform. This is **additional to** the ~$0.45–0.75B sourcing case and is **not** included in that total — it is a distinct working-capital and AP-productivity lever.

MECHANISM	RESOURCE / TIME	$ VALUE	BASIS
Dynamic discounting / early-payment capture early-pay discounts on addressable AP spend	`automated offers at invoice approval`	`~$25–60M/yr`	`~20–30 bps on addressable AP`
DPO optimisation / working capital pay-term discipline & timing control	`payment scheduling on-platform`	`working-capital release`	`one-time + recurring float`
AP-team productivity touchless 2/3-way match	`straight-through invoice processing`	`FTE effort avoided`	`lower cost-per-invoice`
Duplicate-payment & invoice-fraud avoidance AI match + anomaly detection pre-payment	`flagged before disbursement`	`leakage avoided`	`~10–30 bps of AP typical`

Read it as: the pay-side adds an anchor `~$25–60M/yr` from early-payment discount capture alone, plus working-capital release, AP productivity, and duplicate / fraud avoidance. **Clearly separate** from — and additive to — the buy-side sourcing savings; the two value pools are never summed into a single blended rate to avoid double-counting.

06 The efficiency step-change

The benefits above roll up into a measurable step-change across four operational metrics — and a lift in **net procurement efficiency from ~60–70% to ~80–88%**. Green bars show the improved state; deltas are consistent with every figure used elsewhere in this case.



Cycle time
−40%
24d → 14d

Buyer productivity
+35%
~2–3× strategic throughput

Compliance
+20%
in-flow enforcement

Onboarding speed
+50%
cycle halved

Net effect: procurement efficiency moves from `60–70%` to `80–88%` — a `+15–25%` absolute lift in end-to-end effectiveness across the group.

07 ROI & payback

The investment case is asymmetric — but stated honestly and **net of cost**. We size the return against the **total Year-1 investment (~$4.45M)**, not just the platform run-rate, and we ramp the value with the wave rollout rather than assuming full realisation on day one.

COMPONENT	AMOUNT	NOTE
Platform run-rate (SaaS) annual subscription	`~$2.1M`	`recurring`
Implementation config, integration, rollout	`~included`	`Year 1`
Infosys SI systems-integration partner	`~incl.`	`Year 1`
Total Year-1 investment	`~$4.45M`	`platform + impl. + SI`

Realisation ramp — value scales with the wave rollout, it is not realised in full on day one:

PERIOD	% OF STEADY-STATE	VALUE REALISED	COVERAGE
Year 1 Wave 1 — tail, ramp-up	`~30%`	`~$135–225M`	`early adoption`

Year 2 Wave 2 — indirect + tactical	~70%	~$315–525M	scaling
Year 3 — steady state	100%	$0.45–0.75B	full coverage

~215–360×

STEADY-STATE VS. PLATFORM

$0.45–0.75B value vs. ~$2.1M platform run-rate

~100–170×

STEADY-STATE VS. TOTAL Y1

$0.45–0.75B value vs. ~$4.45M total Year-1 investment

< 12 mo

PAYBACK

even Year-1 ramped value (~$135–225M) clears the ~$4.45M cost many times over

THE VALUE-TO-COST RATIO — NET & HONEST

~$4.45MY1

Total Year-1 investment
platform + impl. + Infosys SI

$0.45–0.75B/yr

Steady-state addressable
annual value (~$12B base)

~100–360×

Value dwarfs cost
(~100–170× on total Y1; ~215–360× on platform)

Bottom line — steady-state value vs. total Year-1 cost

$0.45–0.75B vs. $4.45M

> **The fee is a rounding error — and it holds up under scrutiny:** even measured against the full ~$4.45M Year-1 spend (not just the platform) and even in the conservative `~$360M` scenario, the fee is well under `~1.3%` of the annual value at stake. This is not a cost decision — it is a capacity-to-capture decision.

08 Roadmap to value

A **16-week** path to first value, then a wave-based rollout that scales coverage from the easy tail to the strategic core.

16-week implementation

PHASE 1 · WK 1–4

Discovery & Design

Spend & process baseline across BUs; category prioritisation; playbook design; SAP integration blueprint.

PHASE 2 · WK 5–10

Build & Configure

Configure S2P on SAP estate; catalog & guided-buying rules; approval matrices; ESG & audit ledger.

PHASE 3 · WK 11–13

Pilot — 2 categories

Live pilot on 2 categories; validate savings & cycle-time; refine autonomous thresholds.

PHASE 4 · WK 14–16

Rollout & Hypercare

Scale to Wave-1 categories; hypercare support; adoption tracking; savings realisation reporting.

Wave-based category rollout

Start where autonomy is easiest and adoption is fastest; expand toward the highest-value, highest-complexity categories.

WAVE 1 — TAIL

<$50K, ad-hoc & local buys. Fastest to autonomous.

`~40% of transactions`

WAVE 2 — INDIRECT

Catalog, MRO, services, mid-value tactical.

`~70% of transactions`

WAVE 3 — DIRECT & STRATEGIC

Coal, fuel, EPC, heavy equipment — the hard-dollar prize.

`100% of transactions`

09 Why Aerchain — not Ariba / Coupa / GEP

The incumbents digitised procurement. Aerchain **automates the judgment** on top of it — and does so without asking Adani to unwind its SAP investment.

AI-native, not bolted-on

Aerchain was built AI-first — autonomous sourcing, cleansheet, and offer normalisation are **core**, not add-on modules retrofitted onto a legacy P2P suite.

Full suite + autonomous depth

One platform spans strategic, tactical, autonomous, catalog, self-service PO, non-PO and RC invoice — with genuine **autonomous-sourcing depth**, not just workflow.

SAP-native, sits on your estate

Runs **on top of** SAP Ariba, Business Network and S/4HANA. **Zero rip-and-replace** — Adani's 14→18-instance estate stays.

Proven at conglomerate scale

Deployed **group-wide at a peer Indian conglomerate** and across large multinational manufacturers — complexity and scale comparable to the Adani portfolio. Aggregate footprint: **45+ enterprises, $45B+ spend processed, 150K+ suppliers**.

> **The distinction:** Ariba / Coupa / GEP are systems of record. Aerchain is a **system of action** that sits on the record you already have — which is precisely why it lands fast on Adani's existing estate.

10 Next steps

Four timed, low-friction steps — from alignment to a live proof on Adani's own data, to a kicked-off Phase 1 — inside a month.

1 WEEK 1 **Executive alignment**
30-minute session with the CPO office to align on scope, priority categories and success metrics.

2 **WEEK 2** **Should-cost challenge**
We take one real, recently-awarded project and run an AI cleansheet against it — a live, no-obligation proof of savings.

3 **WEEK 3** **Live demo on Adani data**
End-to-end guided + autonomous sourcing demonstrated on a representative Adani category and vendor set.

4 **WEEK 4** **Phase-1 kickoff**
Green-light discovery & design; stand up the joint team; lock the 16-week plan.

The ask: let us run a should-cost challenge on one real awarded project. If we cannot show credible, defensible savings on Adani's own data, there is nothing further to discuss. If we can — the case above scales it to `$0.45–0.75B` a year on the ~$12B addressable base.

AERCHAIN

Strictly Confidential — prepared for the Adani Group. Figures are modelled estimates of identified, addressable annual value and are conservative and directional, not a guarantee.
